

Comments to Ojala et al, 2006:

The study sample showed to be too small for detecting any significant differences between the groups. The number of inadequate recordings was large and may have influenced the results. The algorithm used for calculating metabolic acidemia/acidosis was not the same as in the two first randomised controlled trials comparing STAN to CTG (Westgate et al 1993, Amer-Wahlin et al 2001). As a consequence the current study results are not comparable to these earlier performed randomised trials and can therefore not be added to the meta-analysis presented in the latest Cochrane review of ST-analysis.
